

Dewlock

SUI OVERFLOW 2026

DeFi & Payments · DeepBook

LIVE · dewlock.vercel.app

Every transaction, sealed before you sign.

An intent-firewall for agentic Sui DeFi. You state a goal in plain language → an AI agent that holds **zero user-fund keys** compiles it into one unsigned transaction → a deterministic, fail-closed **Guardian** re-derives the math and dry-runs that exact bundle → you sign the literal artifact you saw (WYSIWYS) → an immutable receipt lands on Walrus.

how it works

what's inside

Fail-closed Guardian

Deterministic code re-derives every number — allowlist, WYSIWYS digest, trusted-price caps, min-out re-derive, price-impact & gas guards.

Full DeFi coverage

Swap (Cetus + Aftermath), transfer (SuiNS + friend book), lend (NAVI / Suilend), Wormhole redeem — one value action per PTB.

DeepBook POST_ONLY

"Wait at my price, don't market-buy" — a real limit order, impossible on an AMM, on the same Guardian spine.

Seal-encrypted chat

Personal conversations encrypted client-side with Mysten Seal — only your wallet can decrypt. The server stores opaque ciphertext.

The BLOCK, provable

A deliberate fail-closed block writes an immutable Walrus receipt anchored on a Sui object — proof a block happened, not just a tx.

Receipts & Passport

Immutable action receipts + an on-chain identity Passport (level, XP, badges) on Walrus and Sui.

Atomic composite · one signature NEW

"Swap 2 SUI to USDC **then** lend it on NAVI" compiles into **one PTB you sign once** — all-or-nothing. The Cetus aggregator's output coin feeds the NAVI deposit *inside* the transaction; the Guardian re-verifies the whole composite. Can't compose → safely degrades to step-by-step.
